

POTENTIAL CONTRIBUTIONS TO THE SOURCE CODE FROM THE DEVELOPER COMMUNITY

New relevant datasets to be incorporated into the model, or the same but with greater temporal and/or spatial granularity

Automatization of the back-end processes to update the data and results periodically

Incorporation of best coding practices into the original source code

Access to the full code by relevant organizations (government, civil society or researchers) to build on the first version of the model and/or integrate with their own systems. This will only be possible when the goal of accessing the code is to identify areas to target policies and services that aim to help the population. In this case, if the final platform or product is made public, it should be acknowledged that it was built based on DPA's model, and that we do not hold responsibility for actions taken based on the leveraged use of that model.
